Animal Shelter DataBase

System Requirements :

The system keeps track of staff information such as staff ID, name, role, salary, and hire date. Staff members are responsible for providing daily care to animals and performing medical procedures.

Each staff member can handle multiple animals and perform many medical records.

Animal information is an essential part of the system. The system stores animal details including animal ID, name, type, gender, status, arrival date, and adoption date. Each animal receives daily care from staff members, can have multiple medical records, resides in one housing unit, and may be adopted by an adopter.

Medical records are used to track the health status of animals. The system stores medical record information such as record ID, record date, spay status, vaccination status, and procedure type. Each medical record is related to one animal and is performed by one staff member, while each animal can have multiple medical records.

The system also manages adopter information, including adopter ID, name, address, email, and phone number. An adopter can adopt more than one animal, but each animal can only be adopted by one adopter at a time.

Housing units are used to organize animals inside the shelter. The system stores housing unit details such as unit ID, section, unit type, capacity, and occupied count. Each housing unit can contain multiple animals, while each animal resides in only one housing unit.

Overall, the system ensures accurate data management for animal care, medical treatment, housing, and adoption processes, making the shelter operations more efficient and organized.

ERD

The ERD is a diagram that shows the main tables in the database and the relationships between them. It helps us understand the structure of the animal shelter system clearly.

Mapping

Mapping is the step where we take the ERD and turn it into actual tables with their primary keys, foreign keys, and relationships.

- Mapping helps prepare the final structure of the database before implementation.
